We have not given profound study to the laws produced by logical relations.

The main focus of this work will be to present an analysis of the logical implications of the set of logical relations that form the basis of the logical calculus.

The first implication of the logical relations is that they are consistent. The second implication is that they are complete. This is to show that the logical relations can be reduced to a finite number of relations. Further, such a consideration can be repeated as follows. Each relation is consistent with the others and, consequently, the set of relations forms a consistent set.

The first implication which we have made is that we have not considered a work of this sort under certain conditions. The scope of this work will be more easily understood if we consider the set of logical relations once more.

The second set of logical relations which we have considered is that of the logical relations of the set of logical relations. The logical relations of the set of logical relations are consistent, and every set of logical relations which forms the basis of the logical calculus is consistent.

To summarize, the set of logical relations forms a consistent set. The logical relations can then be reduced to a finite number of relations. The completeness of the logical relations is thus established.
I. THE HISTORY OF REFORMED WORSHIP
